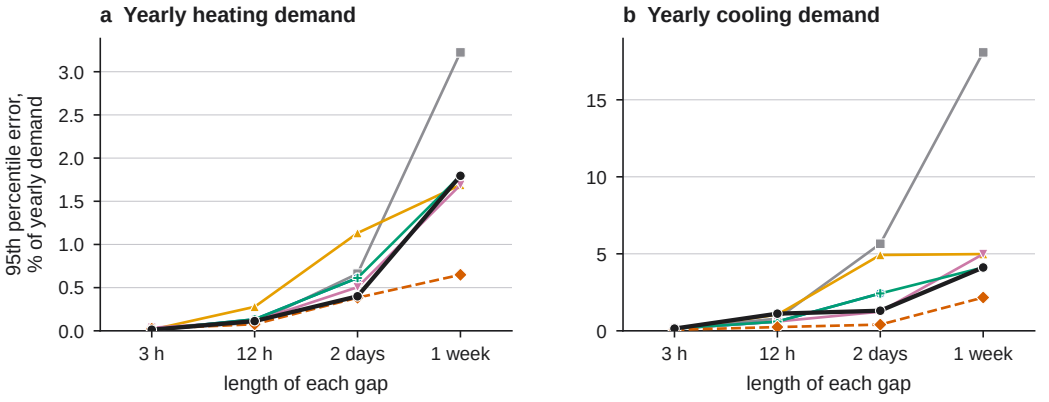
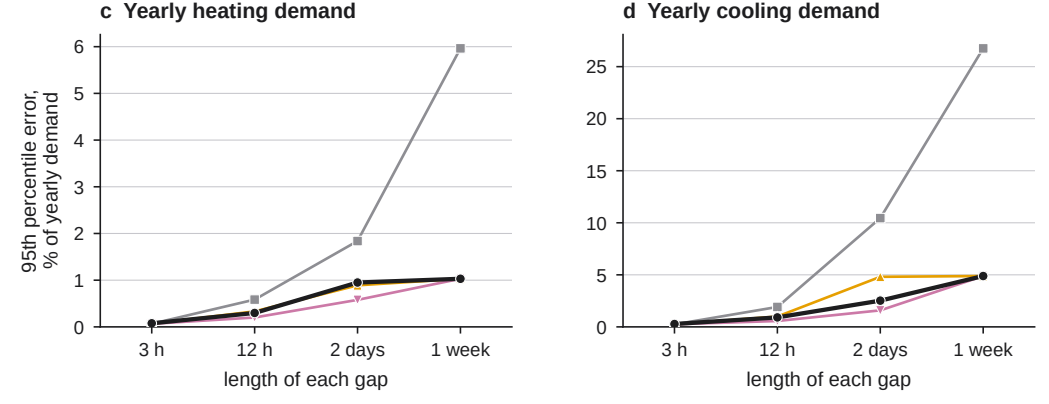
random gaps, 17 region-years × 6 buildings; y-axes differ between panels

General weather hidden (temperature, humidity, pressure, wind)



Solar radiation hidden (global, direct and diffuse)



* only gaps where a nearby station passed the test (about a third of cases)

filling over time stops at 48 h and matches the older order up to 2 days

solar (c, d) has no nearby-station step, so filling over time matches smhi2epw up to 2 days; above 2 days smhi2epw and diyepw-style use ERA5, so all three match at 1 week
