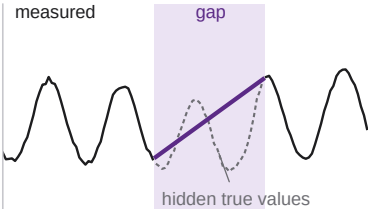
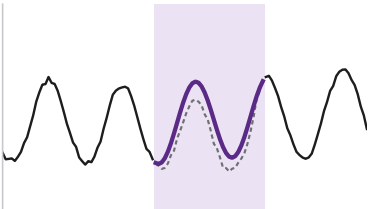
a Linear interpolation

A straight line between the last value before and the first value after the gap



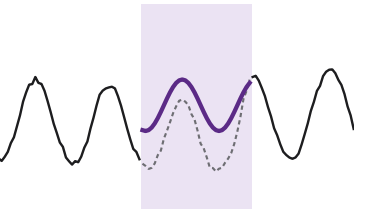
b Daily patterns

The shape of the days either side, adjusted to meet both ends of the gap



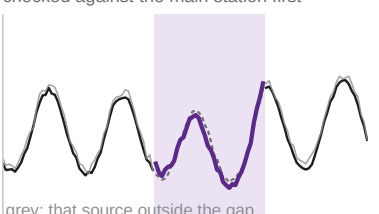
c Four-week average (as in diyepw)

The average of the same hour of day over the four weeks around the gap



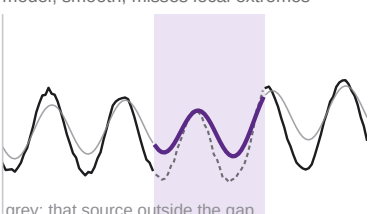
d Nearby station

The same hours from a nearby station, checked against the main station first



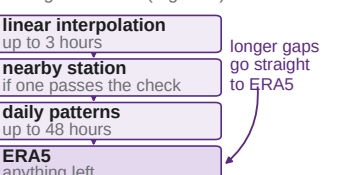
e ERA5

The same hours from a global weather model; smooth, misses local extremes



f Stepwise

Tries the sources in order; long gaps go straight to ERA5 (Figure 1)



Solar radiation: linear interpolation up to 3 hours, then ERA5
