1 Did the year have heatwaves or cold spells?
yes: check those weeks
2 List the filled gaps: length, general weather or solar, share of the year filled
3 Note the season of each gap: winter → heating, summer → cooling, spring solar → heating too
4 Match the gaps to the result you need
Peaks, peak timing, heatwave studies
Could a gap hide the peak? Yes if it falls in the peak season next to the coldest or hottest measured days, or the simulated peak lands in or near filled hours
yes
5 Yes: report a range
peak ±15% for a week-long gap, or re-run with a second filling method
no
No: the filled file is safe for this result
Annual cooling
Check summer gaps: a week over a heatwave can move it 6%, or 20% for a solar gap
Annual heating
Safe for gaps up to a week and up to about 8% of the year filled; likely error in Table 8 (under 2%)
